

BitSats: Buy & Sell Through BaseScan

One-page explorer guide for using the router contract

Item	Address / Value
Token contract	0x7700D683731a860523437d3476842Fa08ED2C15e
Router contract	0x97137d335b29743E1b9434f8Cc594D50572dE5a7

A. Buy tokens with ETH

1. Open the router contract on BaseScan and connect your wallet: Contract -> Write Contract -> Connect to Web3.
2. Find the buy function. In the Value field, enter the ETH amount to spend, e.g. 0.001 ETH.
3. Enter the PoolKey exactly as required by the form. Use native ETH as currency0: 0x00.
4. Use your wallet address as recipient.
5. Click Write, approve the wallet prompt, then wait for confirmation.

B. Approve the router before selling

1. Open the token contract on BaseScan: Contract -> Write Contract -> Connect to Web3.
2. Call approve(spender, amount).

approve field	Enter this
spender	0x97137d335b29743E1b9434f8Cc594D50572dE5a7
amount	115792089237316195423570985008687907853269984665640564039457584007913129639935

This amount is max uint256. It gives the router a maximum allowance, so users do not need to approve before every sell. Only approve contracts you trust.

C. Sell tokens for ETH

1. Open the router contract again: Contract -> Write Contract -> Connect to Web3.
2. Find the sell function.
3. Enter the same PoolKey used for buying. Enter your wallet as recipient.
4. Enter the token amount in 18-decimal units. Example: 1 token = 1000000000000000000.
5. Click Write and confirm in your wallet.

PoolKey reminder

currency0	0x00
currency1	Token contract address above
fee	3000
tickSpacing	60
hooks	Hook contract address used when the pool was initialized
tuple format	(currency0,currency1,3000,60,hooks)

Safety notes:

- Use the correct network and explorer. Buy transactions must include ETH in the Value field.
- If BaseScan says the transaction may revert, check the PoolKey, wallet balance, approval.
